

Understand Instant Video Clip Sharing on Mobile Platforms: Twitter's Vine as a Case Study

Lei Zhang, Feng Wang, and Jiangchuan Liu

March, 2014

- Introduction
- Twitter's Vine: Architecture and Features
- Datasets and Analysis
- Discussions and Conclusions

- The 3-stage evolution for video sharing service

- 1st generation: video sharing sites

- 2nd generation: online social networks

- 3rd generation: mobile platforms (instant video clips)

- Mobile is the trend:
 - 526 million mobile devices and connections were added in 2013 globally (smartphones account for 77%)
 - Global mobile data traffic will increase nearly 11-fold between 2013 and 2018

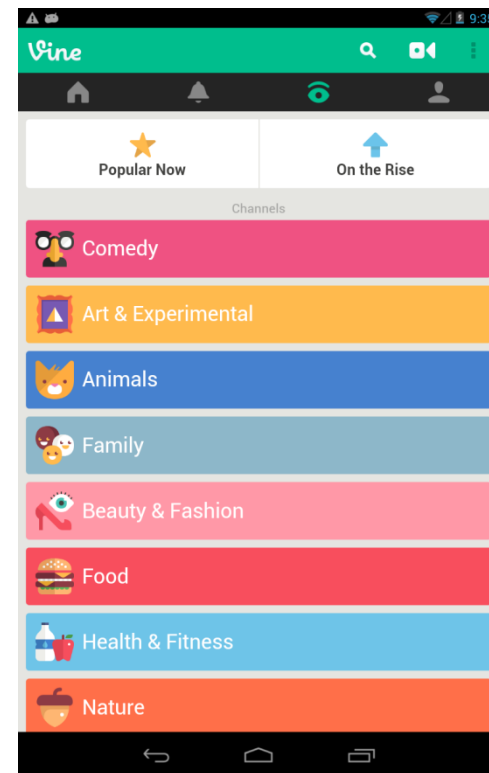

Percentages refer to device or connections share.
 Source: Cisco VNI Mobile, 2014

Figures in parentheses refer to traffic share in 2018.
 Source: Cisco VNI Mobile, 2014

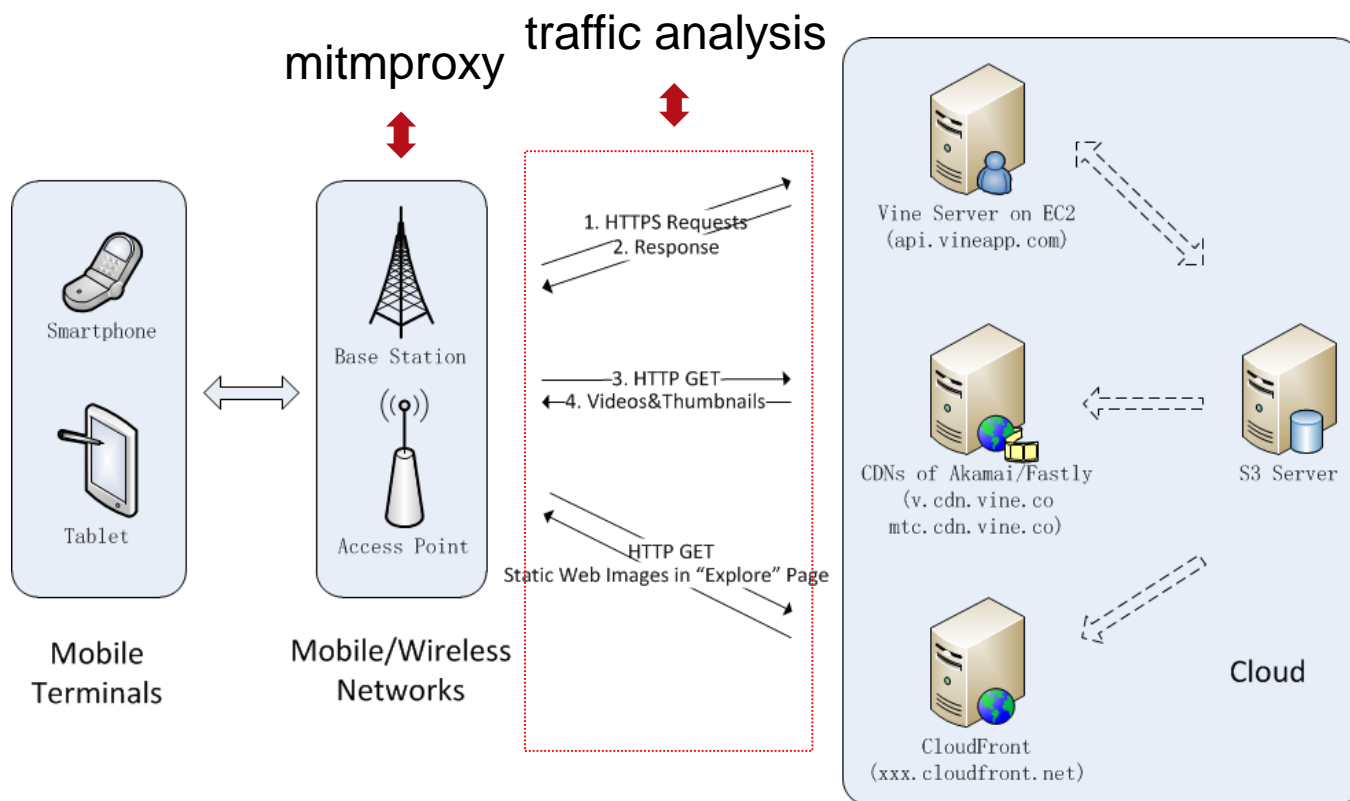

- **Vine** : A representative
 - Exclusive for mobile platforms
 - Maximum video length: six seconds
 - Recently released:
 - iOS, January 2013
 - Android & Windows Phone, June 2013
 - Popular: over 40 million registered users

- The interface:
 - Home
 - Posts from followings
 - Explore
 - Promotion channels
 - Popular posts
 - User channels
 - Different topics
- Key behaviors (screen scrolling):
 - Batch view
 - Passive view

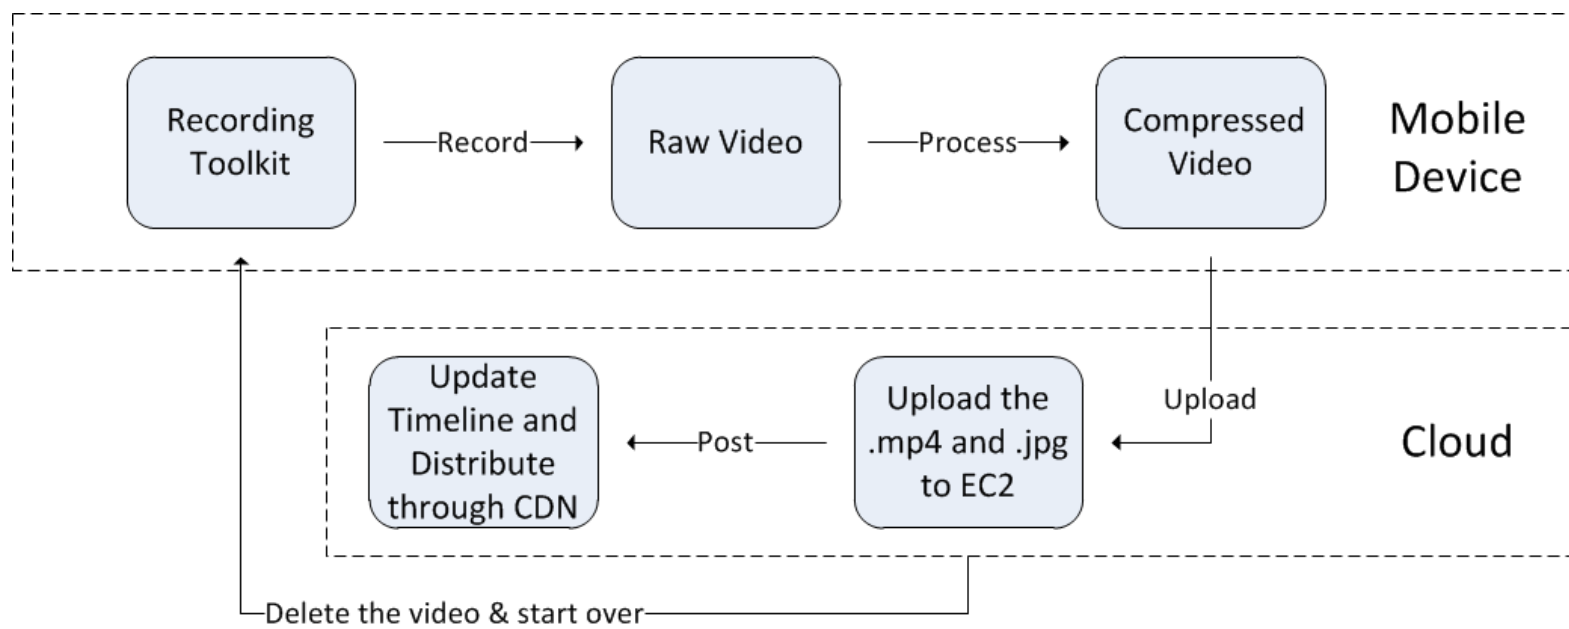

A Closer Look at Vine

- Unveil Vine's architecture (reverse engineering):
 - Packet sniffing & SSL interception

A Closer Look at Vine

- What's the internal process when a user vines?
 - Application runtime monitoring
 - Trace-driven analysis

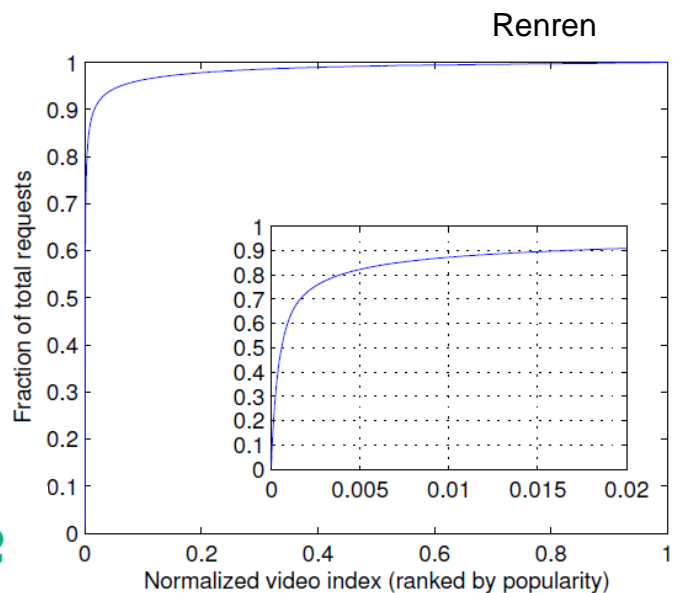

- Develop customized crawlers, and collect data from November 16 to December 14, 2013
- Repost traces of over 50,000 video clips
 - 2 promotion channels: 8,891 posts
 - 16 user channels: 47,794 posts
- Over 1,000,000 user profiles (follower, following, posts)

- Extremely skewed
 - User channels: the top 5% video clips accounts for more than 99% reposts!

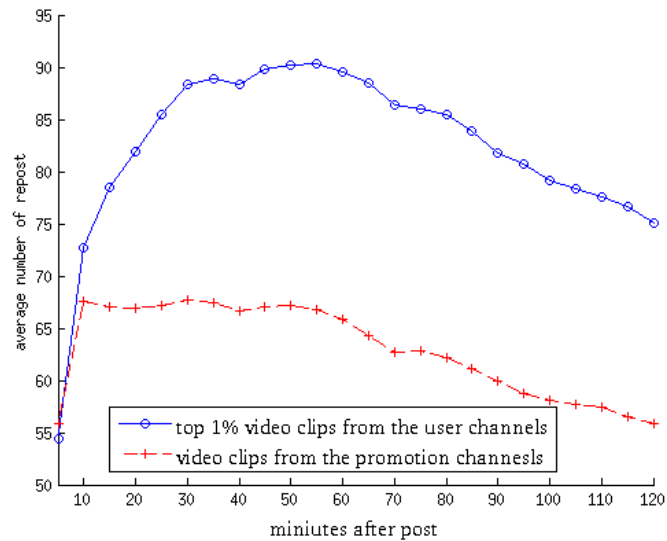

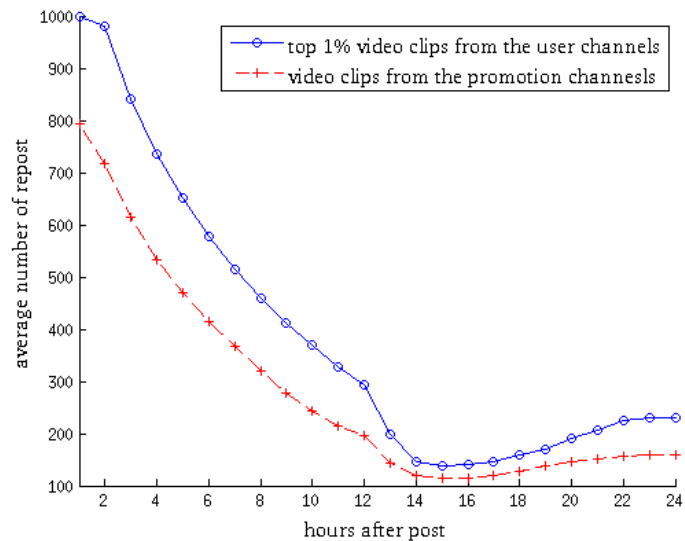

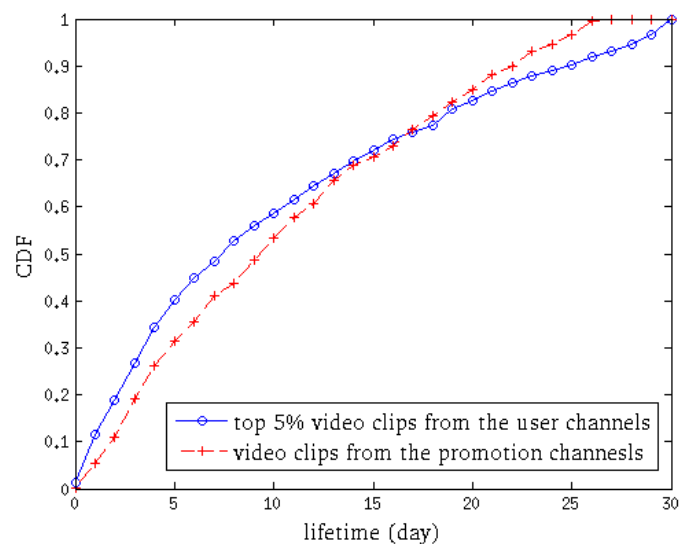

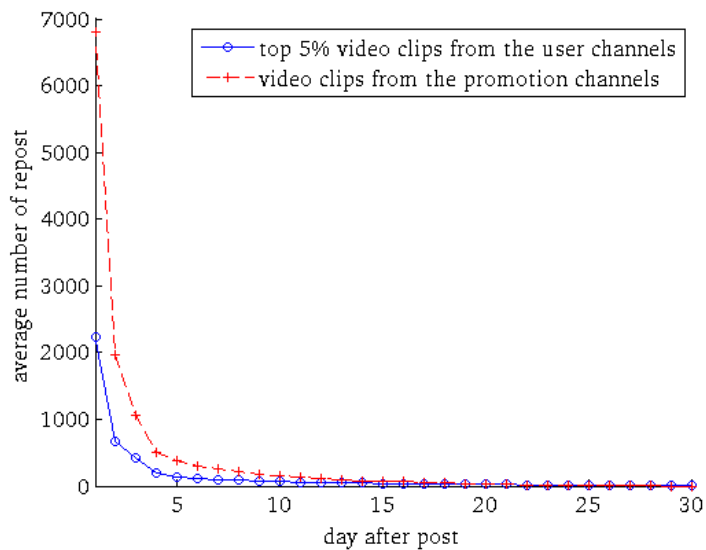

Comparison

- 1st generation
 - YouTube: 10%-80% [Cha, IMC'07]
- 2nd generation
 - Renren: 2%-90%, 5%-95% [Li, NOSSDAV'12]
- 3rd generation
 - Vine: 2%-95%, 5%-99%

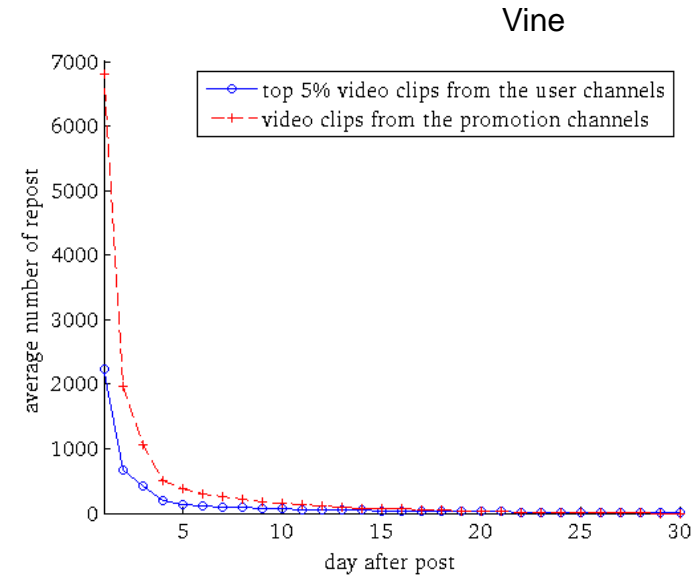

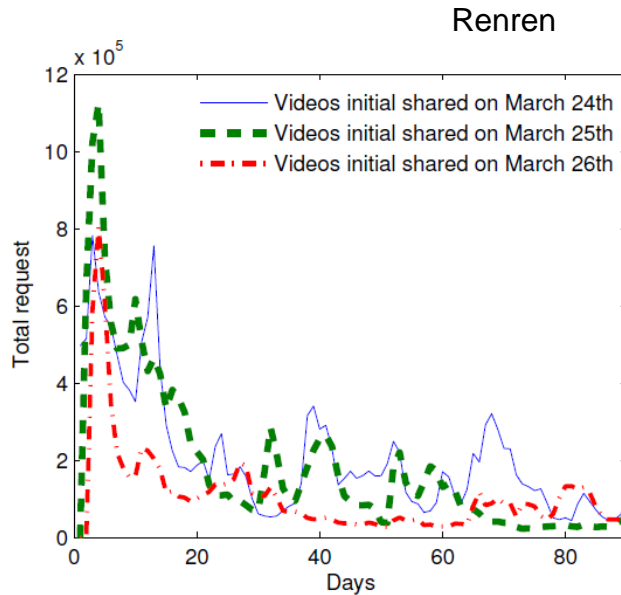

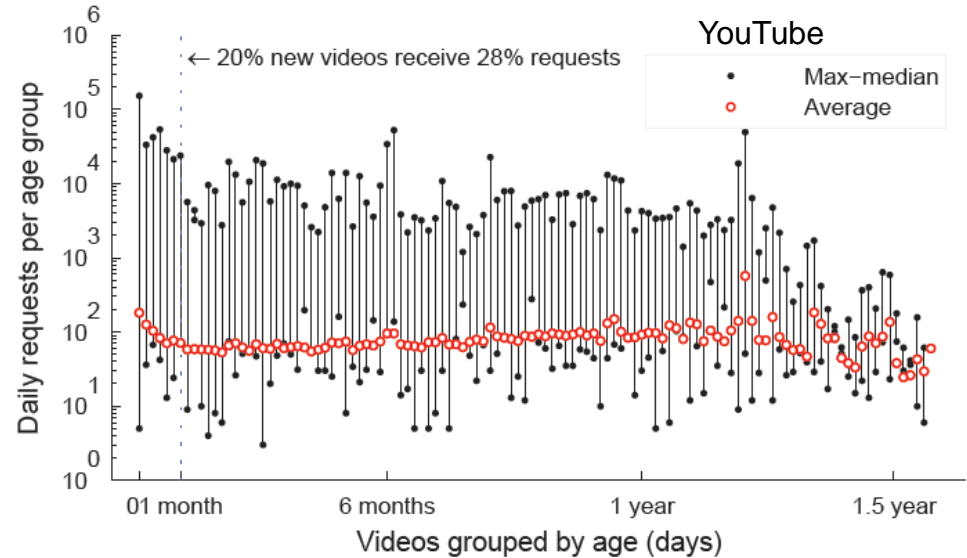

Video Propagation

Comparison

- Vine decays faster
- Mobile nature:
 - Ubiquitous

- Degrees of nodes:
 - 244.4 followers and 102.4 followings in average

- Still evolving:

username	number of followers
KingBach	4,327,113
JEROME JARRE	3,603,981
Marcus Johns	3,565,338
Josh Peck	3,547,111
Nicholas Megalis	3,398,624
DEM_WHITE_BOYZ	3,186,003
Curtis Lepore	3,067,646
Kc James	2,978,526
Alx James	2,859,786
Rudy Mancuso	2,686,820

Table 1: Top 10 of the most followed users

- Follower vs. Following
 - No strong correlation
 - Correlation coefficient is only 0.0254
 - Small probability for mutual friends

- Taking Vine as a case:
 - The first work on instant video clip sharing service
 - unique behaviors, architecture, video properties, social network
 - Our findings about instant video clips
 - high skewness, fast decay

- Potential topics:
 - Distribute effectively and effectively
 - Popularity prediction
 - Energy saving for mobile systems
 - Batch transmission
 - Smart scheduling

Thank you!
